**WEGGO!**

• Add links to other websites

10 mins

1. Get started

The World Wide Web is a system which allows web pages to link to other web pages. So lets link your web page to others on the web.

Click the rubbish bin to clear your page.

2. The "a" tag

The link block, `<a>`, is a content tag which goes inside other blocks, rather than on its own (such as an `<h1>` tag).

Drag a `<p>` tag into the Code Area, than drag an `<a>` tag on top of it from the "Links" section of the Block Box.

3. Understanding the "a" tag

The `<a>` tag has three attributes:

`href` - the web address of the page you're linking to

`title` - the name of the page you're linking to. This is displayed when you hold your pointer over a link

`link text` - the text which is displayed on your page and is clicked by the user
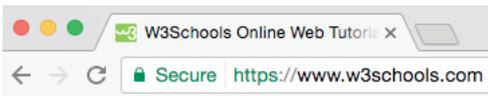

More >

4. Add content blocks

Lets add the web address to the <a> tag. First, drag the URL content block onto the <a> block in the code area. It snaps into the correct place. Do the same for the Title and Link Text blocks.

"Link Text" will appear in the output window.

5. Adding a URL

The URL is the web address of the page we're linking to. Click on the URL block and type a web address to link to.
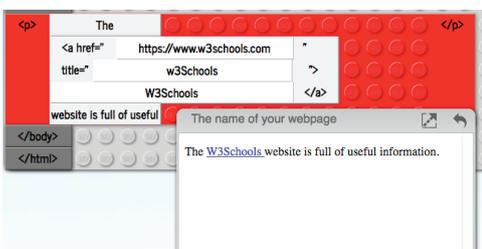

Note that some websites cannot be displayed in the output window. https://www.w3schools.com is a good address to use. Remember to include "https://www." to the start.

6. Adding a picture

Edit the Title and Link Text blocks to provide suitable information.

7. Including a link in more text

You may want a link as part of other text. Try creating a new paragraph and adding some text, then a link, then some more text.

Links can also be added headlines and lists in Weggo.

Well done!
